On random walks with dependence of its past ERMAC 2024–SBMAC–Regional 8

Cristian Coletti - UFABC - cristian.coletti@ufabc.edu.br

Joint work with Renato Gava (UFSCAR), Gunter Schütz (ICS), Ioannis Papageorgiou (UFABC), Denis Araujo Luiz (UFABC) and Lucas de Lima (UFABC - USP)

28 de agosto de 2024

Outline

- Introduction
- The ERW model
- Main results
- Two repelling Random Walks

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

• Idea of the proof

Introduction

In the first part of the talk, we consider the so called elephant random walk introduced by Schutz and Trimper and a related model, the D.E.R.W.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Introduction

- In the first part of the talk, we consider the so called elephant random walk introduced by Schutz and Trimper and a related model, the D.E.R.W.
- In the ERW the walker remember the whole past. Thus, the next step always depends on the whole past.

Introduction

- In the first part of the talk, we consider the so called elephant random walk introduced by Schutz and Trimper and a related model, the D.E.R.W.
- In the ERW the walker remember the whole past. Thus, the next step always depends on the whole past.
- Martingale theory allows to prove many limit theorem for this model and its generalization.

Recurrence – Transience for the ERW

Theorem (I. Papageorgiou, C)

Let $(X_n)_{n\geq 0}$ be the ERW with full memory. Then, if $p \leq 3/4$ the ERW is recurrent.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Recurrence – Transience for the ERW

Theorem (I. Papageorgiou, C) Let $(X_n)_{n\geq 0}$ be the ERW with full memory. Then, if $p \leq 3/4$ the ERW is recurrent.

Remark Indeed, if p < 1/6 the ERW is positive recurrent.

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬる

Recurrence – Transience for the ERW

Theorem (I. Papageorgiou, C) Let $(X_n)_{n\geq 0}$ be the ERW with full memory. Then, if p > 3/4 the ERW is transient.

• The CLT says that if X_1, \ldots, X_n, \ldots are i.i.d. rv's with mean μ and variance σ^2 then

$$\lim_{n \to +\infty} \mathbb{P}\left(\frac{S_n - n\mu}{\sqrt{n\sigma}} \le x\right) = \Phi(x), \tag{1}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

where
$$\Phi(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{x} e^{-s^2/2} ds$$
.

• The CLT says that if X_1, \ldots, X_n, \ldots are i.i.d. rv's with mean μ and variance σ^2 then

$$\lim_{n \to +\infty} \mathbb{P}\left(\frac{S_n - n\mu}{\sqrt{n\sigma}} \le x\right) = \Phi(x), \tag{1}$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

where
$$\Phi(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{x} e^{-s^2/2} ds$$

How good is this approximation?

• The CLT says that if X_1, \ldots, X_n, \ldots are i.i.d. rv's with mean μ and variance σ^2 then

$$\lim_{n \to +\infty} \mathbb{P}\left(\frac{S_n - n\mu}{\sqrt{n\sigma}} \le x\right) = \Phi(x), \tag{1}$$

where
$$\Phi(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{x} e^{-s^2/2} ds$$
.

How good is this approximation? Under the same hypothesis we have

$$\lim_{n \to +\infty} \sup_{x \in \mathbb{R}} \left| \mathbb{P} \left(\frac{S_n - n\mu}{\sqrt{n\sigma}} \le x \right) - \Phi(x) \right| = 0.$$
 (2)

where $b_n = \sqrt{n \log(\log(n))}$.

• What can be said in the case of correlated r.v.'s?

Invariance principle. C, Gava and Schütz

Thm: Let (X_n)_{n≥1} be the ERW with p ≤ 3/4 and let {W_t}_{t≥0} be B.M. Then, there exists a common probability space to X_n and W_t s.t.

a) If p < 3/4, then

$$\left|\sqrt{3-4p}\frac{X_n}{n^{2p-1}} - W(n^{3-4p})\right| = o(\sqrt{n^{3-4p}\log\log n}) \quad \text{a.s.}$$

b) If p = 3/4, then

$$\left|\frac{X_n}{\sqrt{n}} - W(\log n)\right| = o(\sqrt{\log n \times \log \log \log n})$$
 a.s.

Law of iterated logarithm (C, Gava and Schütz)

Corollary: Let (X_n)_{n≥1} be the ERW and let p ≤ 3/4.
 a) If p < 3/4, then

$$\limsup_{n\to\infty}\frac{|X_n|}{\sqrt{n\log\log n}}=\sqrt{\frac{2}{3-4p}} \text{ a.s.}$$

b) If p = 3/4, then

$$\limsup_{n \to \infty} \frac{|X_n|}{\sqrt{n \log n} \times \sqrt{\log \log \log n}} = \sqrt{2} \text{ a.s.}.$$

where \mathcal{I} denotes the σ -algebra of T-invariant sets, i.e. $\mu(T^{-1}(A)\Delta A) = 0.$

About the ERW and the DRW. Remember that P_E is the increments law for the ERW and P_D is the increments law for the DRW.

•
$$P_E[X_n = \eta | X_1, \dots, X_{n-1}] = \frac{1}{2n} \sum_{k=1}^n [1 + (2p - 1)X_k \eta]$$
 for $n \ge 1$;

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

•
$$P_E[X_1 = \eta] = \frac{1}{2}[1 + (2q - 1)\eta];$$

►
$$P_D[X_n = \eta] = \frac{1}{2}[1 + (2f(T^n x) - 1)\eta].$$

Here, $\eta \in \{-1, 1\}.$

Dynamic Random Elephant

Modelo DRE

Let $g:\mathbb{R} imes\mathbb{N} o [0,1].$ We say that the random walk $S_n=X_1+\dots+X_n$ is a DRE if

•
$$P[X_1 = \eta] = g(\alpha, 1)P_E[X_1 = \eta] + (1 - g(\alpha, 1))P_D[X_1 = \eta];$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

$$P[X_n = \eta] = g(\alpha, n) P_E[X_n = \eta | X_1, \dots, X_n] + (1 - g(\alpha, n)) P_D[X_n = \eta]$$

Results

First results

•
$$\mathbb{E}[X_{n+1}|X_1, \dots, X_n] = \frac{\alpha_{n+1}(2p-1)}{n}S_n + (1 - \alpha_{n+1})(2f(T^{n+1}x) - 1);$$

Set $a_n = \prod_{k=1}^{n-1} \left(1 + \frac{g(\alpha, k+1)(2p-1)}{k}\right).$
• $\mathbb{E}[S_n] = a_n \left(g(\alpha, 1)(2q - 1) + \sum_{k=1}^n \frac{(1 - g(\alpha, k))(2\mathbb{E}[f(T^kx)] - 1)}{a_k}\right)$

Definition

We say that the DRE satisfies the **strong property** if any of the following statements hold

▶
$$p = 1$$
 e lim _{$n \to \infty$} $g(\alpha, n) = \delta \in [0, 1);$

▶
$$p \neq 1$$
 e $\lim_{n\to\infty} g(\alpha, n) = \delta \in [0, 1].$

Strong law of large numbers

If the DRE satisfies the strong property, then

$$\lim_{n \to \infty} \left| \frac{S_n}{n} - \frac{\mathbb{E}[S_n]}{n} \right| = 0 \quad \text{a.s.}$$
 (5)

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Lema

If the DRE satisfies the strong property, then

$$\lim_{n \to \infty} \frac{S_n}{n} = \frac{(1 - \ell(\alpha))}{1 - (2p - 1)\ell(\alpha)} (2\mathbb{E}[f|\mathcal{I}] - 1), \tag{6}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

where $\ell(\alpha) = \lim_{n \to \infty} g(\alpha, n)$ and $L = \lim_{n \to \infty} f(T^n x)$.

Set
$$A_n^2 = \sum_{k=1}^n \frac{1}{a_n^2}$$
.

Central Limit Theorem

Assume that the strong property holds, that $p \ge 1/2$ or, if p < 1/2, $\lim_{n \to \infty} g(\alpha, n) \le \frac{1}{2-4p}$. Then

$$\frac{S_n - \mathbb{E}[S_n]}{a_n A_n} \xrightarrow{\mathcal{D}} \mathcal{N}(0, \lambda), \tag{7}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

where $\lambda = \lim_{n \to \infty} 1 - \left(\frac{S_n}{n}\right)^2$.

Almost Sure Convergence Theorem

Assume that the strong property holds, that p < 1/2 and that $\lim_{n\to\infty} g(\alpha, n) > \frac{1}{2-4p}$. Then,

$$\frac{S_n - \mathbb{E}[S_n]}{a_n} \xrightarrow{a.s.} M \tag{8}$$

Lemma

The process $X = \{X(n)\}_{n \ge 0}$ satisfies the following recursion

$$X(n+1) - X(n) = \gamma_n(F(X(n)) + U_n)$$
(14)

where

$$\gamma_n = \frac{1}{n+1} \tag{15}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

and $F : D \to TD$ is the vector field $F = (F_l^1, F_r^1, F_l^2, F_r^2)$ defined by

$$F(X(n)) = -X(n) + \pi(X(n)).$$
(16)

A discrete-time process whose increments are recursively computed according to (14) is known as a stochastic approximation.

- A discrete-time process whose increments are recursively computed according to (14) is known as a stochastic approximation.
- Provided the random term U_n can be damped by γ_n, (14) may be thought as a Cauchy-Euler approximation scheme,

$$x(n+1)-x(n)=\gamma_n F(x(n)),$$

for the numerical solution of the autonomous ODE

A dynamical system approach

- A discrete-time process whose increments are recursively computed according to (14) is known as a stochastic approximation.
- Provided the random term U_n can be damped by γ_n, (14) may be thought as a Cauchy-Euler approximation scheme,

$$x(n+1)-x(n)=\gamma_n F(x(n)),$$

for the numerical solution of the autonomous ODE

$$\dot{x} = F(x).$$

A dynamical system approach

A natural approach to determine the limit behaviour of the process X consists in studying the asymptotic properties of the related ODE.

A dynamical system approach

- A natural approach to determine the limit behaviour of the process X consists in studying the asymptotic properties of the related ODE.
- This heuristic, known as the ODE method, has been rather effective while studying various reinforced stochastic processes.

- A point $x \in D$ is an equilibrium of F if F(x) = 0.
- For any point x ∈ D, let J_F(x) be the Jacobian matrix of the vector field F at x and let σ(J_F(x)) be the set of its eigenvalues.

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

The equilibrium x is hyperbolic if all the eigenvalues of σ(J_F(x)) have non-zero real parts.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

- The equilibrium x is hyperbolic if all the eigenvalues of σ(J_F(x)) have non-zero real parts.
- The hyperbolic equilibrium x is linearly stable if σ(J_F(x)) contains only eigenvalues with negative real parts; otherwise x is said to be linearly unstable.

Theorem

Assume that $X = (X(n))_n$ be a process satisfying our recursion equation. Then, for any $\beta \ge 0, \beta \ne 2$, the process X converges a.s. to an equilibrium point of our vector field.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Lemma

For $\beta \in [0,2]$, the point $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2})$ is the only equilibrium for the vector field F. For any $\beta > 2$, the field has three equilibria,

Lemma

For $\beta \in [0,2]$, the point $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2})$ is the only equilibrium for the vector field F. For any $\beta > 2$, the field has three equilibria,

$$\left(\frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}\right), \quad (w, 1 - w, 1 - w, w) \quad and \quad (1 - w, w, w, 1 - w),$$
(17)

where $w \in (0, \frac{1}{2})$ is uniquely determined by β .

Lemma

For $\beta \in [0,2]$, the point $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2})$ is the only equilibrium for the vector field F. For any $\beta > 2$, the field has three equilibria,

 $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}), (w, 1 - w, 1 - w, w) \text{ and } (1 - w, w, w, 1 - w),$ (17)

where $w \in (0, \frac{1}{2})$ is uniquely determined by β . The equilibrium $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2})$ is linearly stable for $\beta \in [0, 2)$ and linearly unstable for $\beta > 2$.

(日)(

Non-convergence to the unstable equilibrium

Lemma

Let $X = {X(n)}_{n\geq 0}$ be a process satisfying an stochastic approximation recursion. Then, if $\beta > 2$,

$$\mathbb{P}\left(\lim_{n\to\infty}X(n)=\left(\frac{1}{2},\frac{1}{2},\frac{1}{2},\frac{1}{2}\right)\right)=0.$$

Almost sure convergence of the proportions

Lemma

There is a unique point $x \in [0, 1]$, depending on β , such that,

$$\lim_{n \to \infty} \frac{1}{n} \Big(S_n^1 - S_{n_0}^1, \, S_n^2 - S_{n_0}^2 \Big) \in \Big\{ (x, -x), \, (-x, x) \Big\} \qquad \text{a.s.}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

In addition, if $0 \le \beta \le 2$, then x = 0, and if $\beta > 2$, then 0 < x < 1.

Proof of transience

It follows from the previous lemma that (S¹_n/n, S²_n/n) converges a.s. to (x, −x) or to (−x, x) where x > 0.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

Proof of transience

- It follows from the previous lemma that (S¹_n/n, S²_n/n) converges a.s. to (x, −x) or to (−x, x) where x > 0.
- Since $S_n^i = S_n^i / n \times n$, the proof is complete after making $n \to +\infty$.
